1. Introduction

1.1. Technological Requirements:

Java JDK   https://www.oracle.com/java/technologies/downloads/   jdk-8u202-windows-x64.exe
VS Code   https://code.visualstudio.com/Download   VSCodeSetup-x64-1.103.2.exe
    Extensions: **Extension Pack for Java**

Integrated Development Environment (IDE)
Eclipse IDE: https://www.eclipse.org/downloads/packages/
NetBeans IDE   https://netbeans.apache.org/download/index.html

Variables de entorno
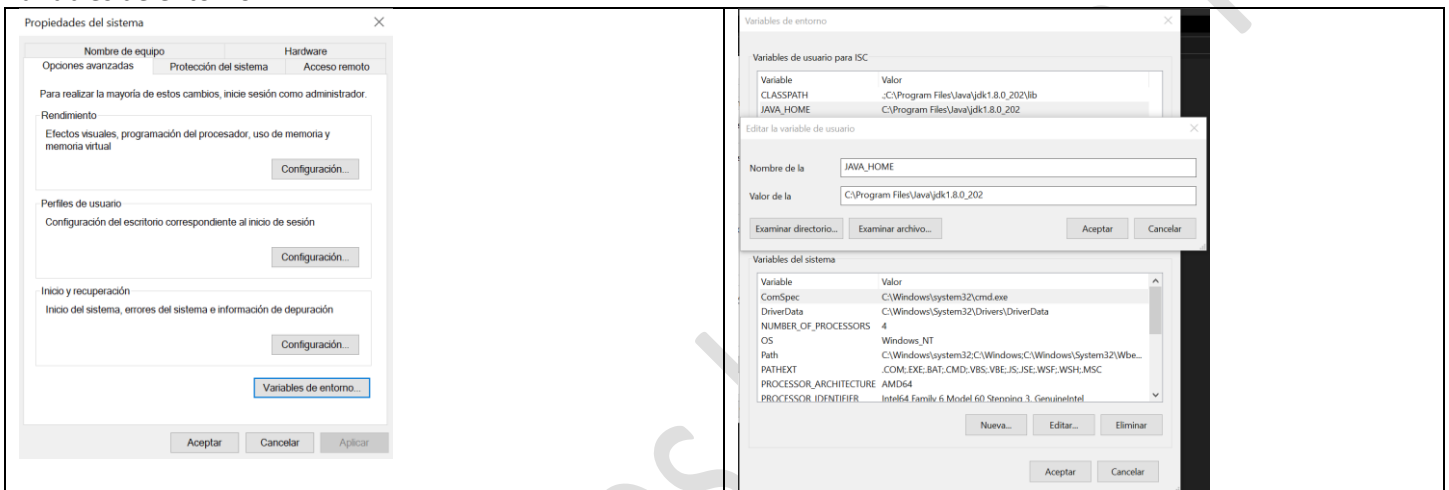

Panel de control -> Sistema -> Configuracion avanzada del sistema
Opciones avanzadas -> Variables de entorno -> Variables de Usuario

JAVA_HOME C:\Program Files\Java\jdk1.8.0_202	PATH %JAVA_HOME%\BIN
CLASSPATH .;%JAVA_HOME%\LIB	Probar Instalación desde CMD C:\>java -version (correr) C:\>javac -version (compilar)

C:\dev>java -version java version "1.8.0_202" C:\dev>javac -version javac 1.8.0_202 C:\dev\poo>javac Hola.java C:\dev\poo>java Hola Hello World!	```java public class Hola { public static void main(String[] args) { System.out.println("Hello World!"); } } ```

→

Crear un Directorio de trabajo
C:\> mkdir dev
C:\dev>

1.2. Create Java Project:

```java
public class App {
    Run | Debug
    public static void main(String[] args) throws Exception {
        System.out.println(x:"Hello, World!");
    }
}
```

```
PS C:\dev\poo> & 'C:\Program Files\Java\
Hello, World!
PS C:\dev\poo>
```

→
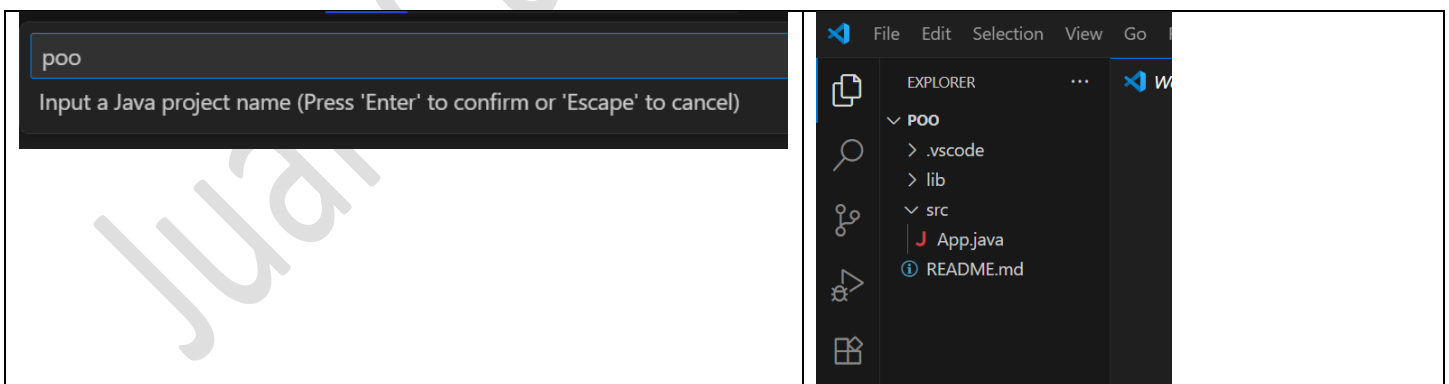

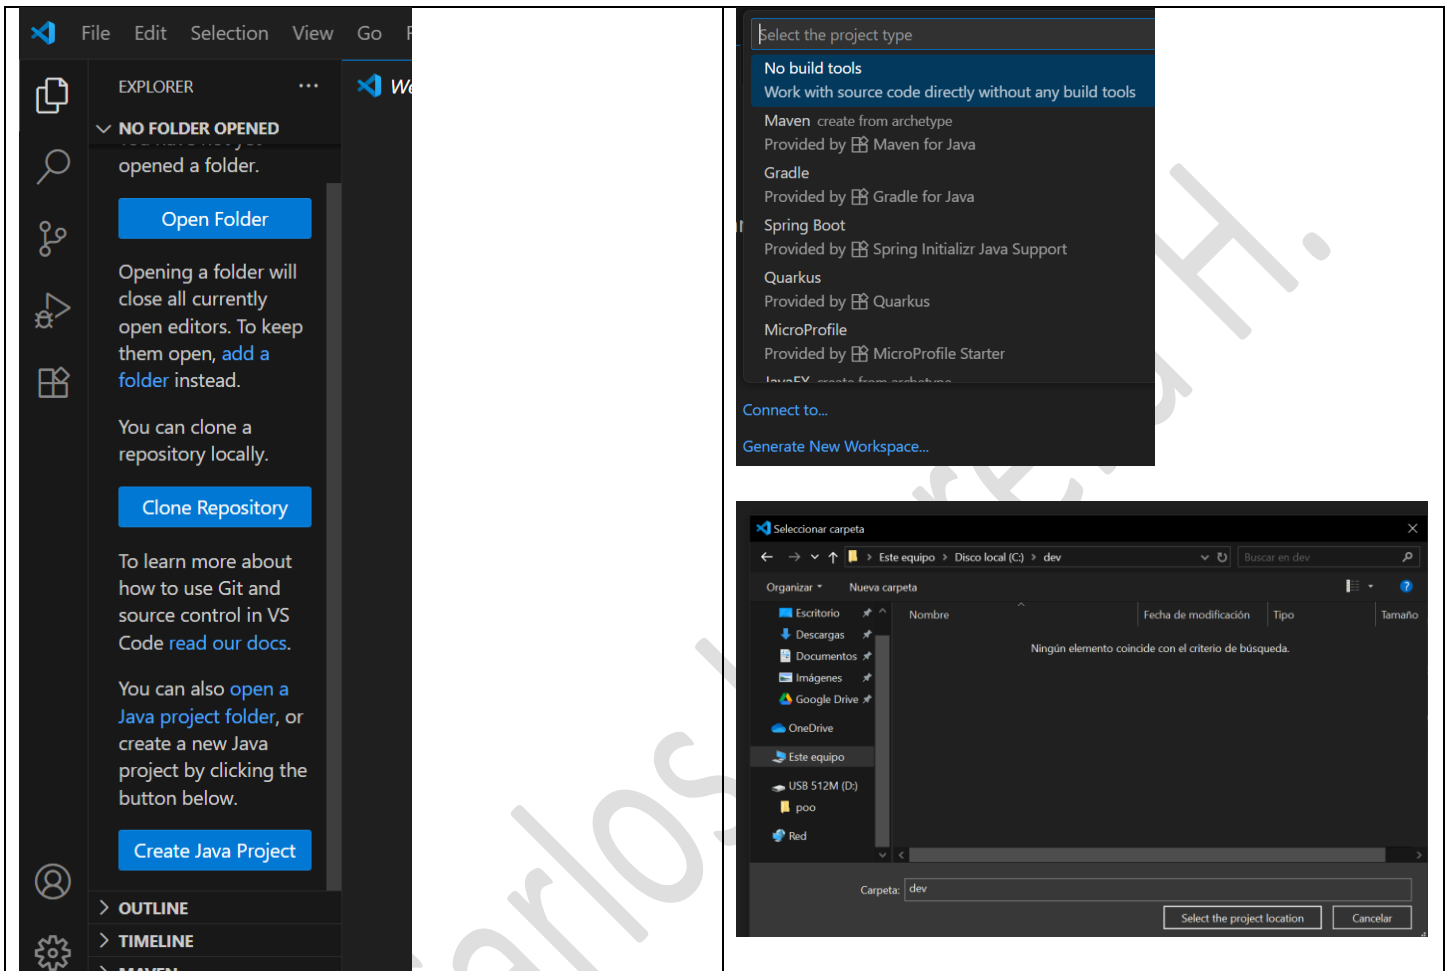

1.3. Setting Up Java

James Gosling is considered the "Father of Java". Duke, the Java Mascot.

Oracle acquired Sun Microsystems in 2010, and released JDK 7 in 2011, and JDK 8 in 2014.

Jakarta EE Is used to create large enterprise, server-side, and client-side distributed applications

Java is Platform-Independent	Java Programs Run in a JVM

Java Runtime Environment (JRE)	Java Development Kit (JDK)
Includes:	Includes:
• The Java Virtual Machine (JVM)	• JRE Java Compiler
• Java class libraries	• Additional tools
Purpose:	Purpose:
• Read bytecode (.class)	Compile bytecode (.java ⬛.class)
• Run the same bytecode anywhere with a JVM	

Compiling and Running a Java Program
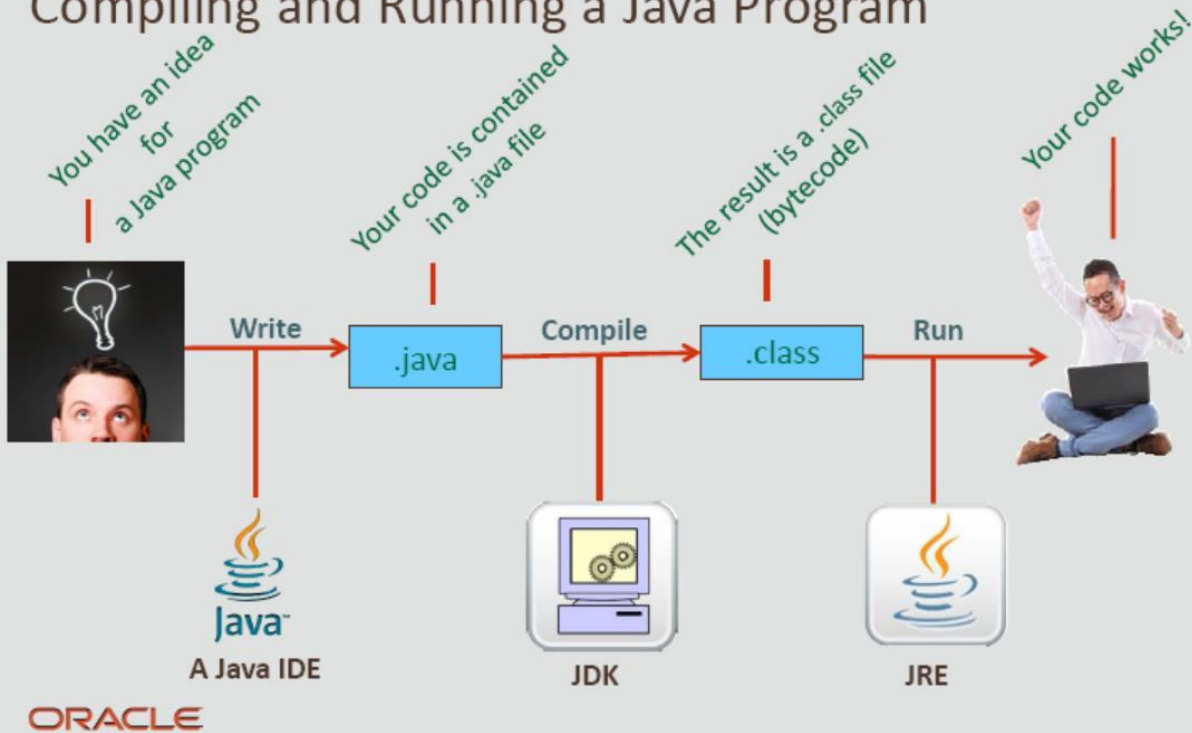

A Java IDE is used to **write** source code (`.java`)

The JDK **compiles** bytecode (`.java` → `.class`)

Bytecode **runs** in a JVM, which is part of the JRE

→

2. Java Basics

2.1. The Software Development Process

Spiral Model of Development

https://objectstorage.uk-london-1.oraclecloud.com/n/lrvrlgaqj8dd/b/Games/o/JavaPuzzleBall/index.html

→
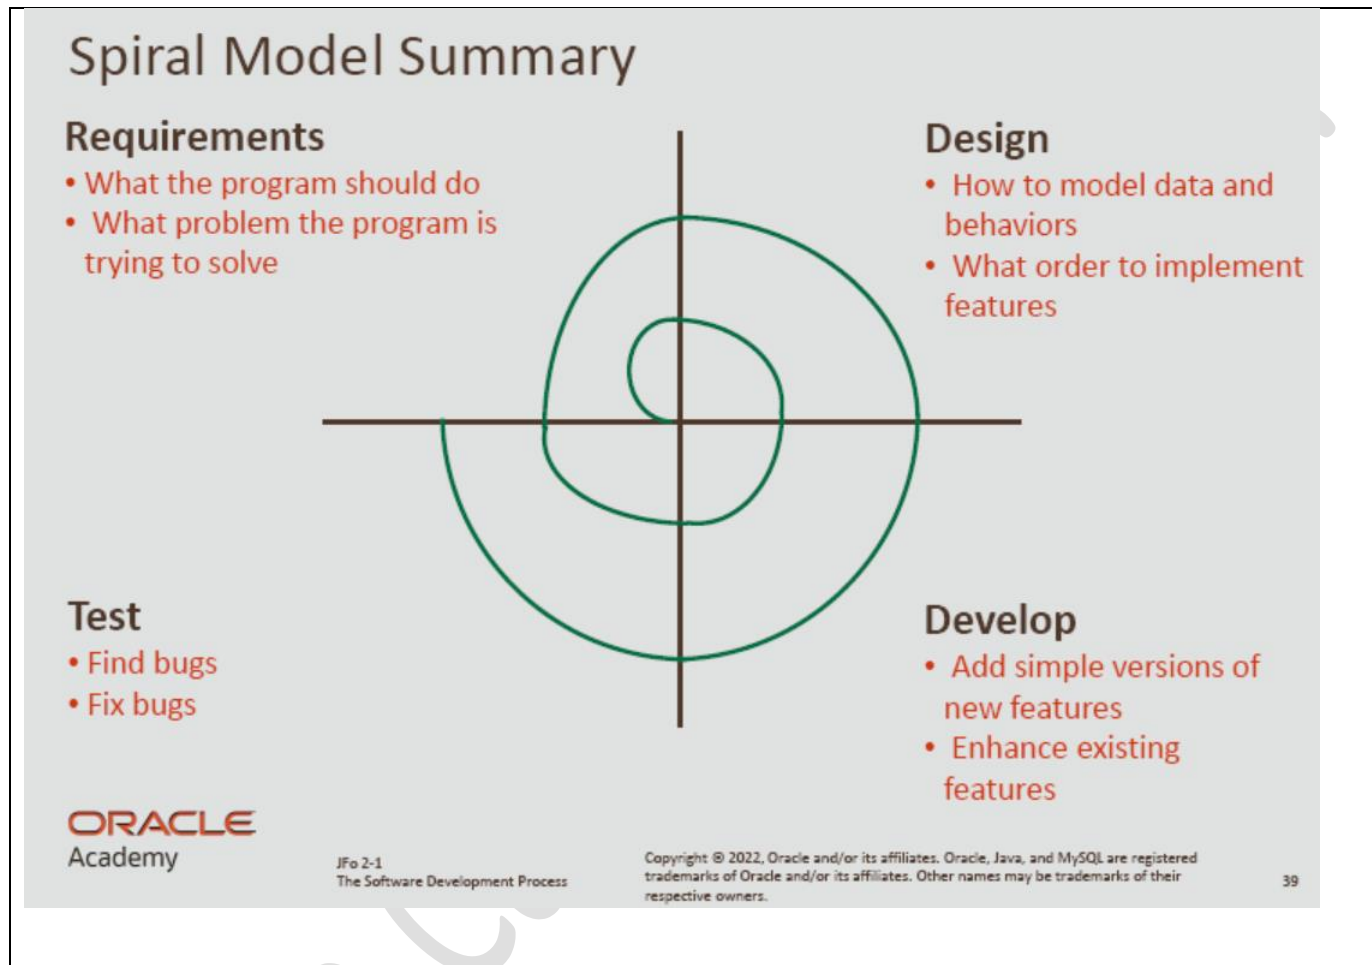

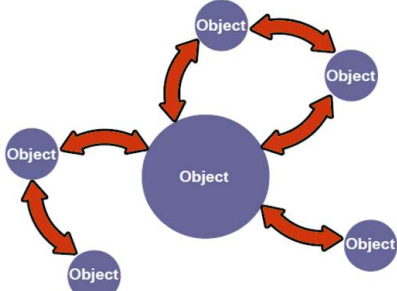

2.2. What is my Program Doing?

Code within curly braces is called a block of code
Indentation before a line of code (4 spaces)
Whitespace
End statements with semicolons (;)
 	
// Single-line comments
 	
Multi-line comments
 /* Bievenidos
     a poo
 */
	public static void NombreMetodo() { . . }
	NombreMetodo(); // llamar al método
	
	Debug
	    To set a breakpoint
	    Press Step Over

2.3. Introduction to Object-Oriented Programming Concepts

Procedural languages …	Object-oriented languages…
• Read one line at a time • The C language is procedural	• Read one line at a time • Model objects through code • Emphasize object interaction • Allow interaction without a prescribed order • Java and C++ are object-oriented languages

Object-Oriented Programming • Interaction of objects • No prescribed sequence	

Modeling Properties and Behaviors

```
1  public class Customer {
2      public String name = "Junior Duke";
3      public int    custID = 1205;
4      public String address;
5      public int    orderNum;
6      public int    age;
7
8      public void displayCustomer(){
9          System.out.println("Customer: "+name);
10     }//end method displayCustomer
11 }//end class Customer
```

Quiz: JFo - Section 2   Questions 15

→

3. Java Data Types

3.1. What is a Variable?

```
String x ="Sam";
System.out.println("My name is " + x);
```
Variables03.java (There are 6 mistakes)

Type	Keyword	Example Values
Boolean	boolean	true, false
Integer	int	1, -10, 20000, 123_456_789
Double	double	1.0, -10.0005, 3.141
String	String	"Alex", "I ate too much dinner."

Variable Naming Conventions

- Begin each variable with a lowercase letter
- Subsequent words should be capitalized: myVariable
- Choose names that are mnemonic and that indicate the intent of the variable to the casual observer
- Remember that …
- Names are case-sensitive
- Names can't include white space

```
Int studentAge = 20;
String myCatchPhrase = "Enjoy Alex Appreciation Day!";
```

3.2. Numeric Data
Integral Primitive Types

Type	Length	Number of Possible Values	Minimum Value	Maximum Value
Byte	8 bits	2^8, or… 256	-2^7, or… -128	2^7-1, or… 127
short	16 bits	2^{16}, or… 65,535	-2^{15}, or… $-32,768$	$2^{15}-1$, or… 32,767
int	32 bits	2^{32}, or… 4,294,967,296	-2^{31}, or… $-2,147,483,648$	$2^{31}-1$, or… 2,147,483,647
long	64 bits	2^{64}, or… 18,446,744,073,709,551,616	-2^{63}, or… $-9,223,372,036,854,775,808L$	$2^{63}-1$, or… 9,223,372,036,854,775,807L

```
+=    -=    *=    /=    %=    ++    --    Pre/Post              a+=b   a = a + ( b )
```

```
// pre y post incremento y decremento

    int players = 0;
    System.out.println("players online: " + players++);
    System.out.println("The value of players is " + players);
    System.out.println("The value of players is now " + ++players);
    System.out.println("The value of players is " + players);
```

Floating Point Primitive Types

Type	Float Length	When will I use this?
float	32 bits	Never
double	64 bits	Often

double x = 9/2;   double x = 9/2.0;

final double PI = 3.141592;

Final variable naming conventions:

- Capitalize every letter
- Separate words with an underscore
        MINIMUM_AGE

Rules of Precedence
- Operators within a pair of parentheses
- Increment and decrement operators (++or --)
- Multiplication and division operators, evaluated from left to right
- Addition and subtraction operators, evaluated from left to right
- If operators of the same precedence appear successively, the operators are evaluated from left to right

```
int x = (((25 - 5) * 4) / (2 - 10)) + 4;
int y = 25 - 5 * 4 / 2 - 10 + 4;
→
```

3.3. Textual Data
Use the char data type
Use Strings
Concatenate Strings
Understand escape sequences
Understand print statements better

Char is used for a single character (16 bits)	A String can handle multiple characters
char shirtSize= 'M';	String greeting = "Hello World!"; // Asignación Hard-coding

Primitives

Type	Length	Data
boolean	1 bit	true / false
byte	8 bits	Integers
short	16 bits	Integers
int	32 bits	Integers
long	64 bits	Integers
float	32 bits	Floating point numbers
double	64 bits	Floating point numbers
char	16 bits	Single characters

Where are Strings?

String is capitalized
- Strings are an object, not a primitive
- Object types are capitalized by convention

Combining multiple Strings is called concatenation
String totalPrice = "Total: $" +3 +2 +1;
String totalPrice = 3 +2 + 1 + "Total: $";
String totalPrice = "Total: $" +(3 +2 +1);

Escape Sequence
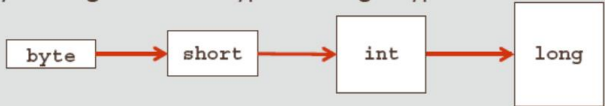

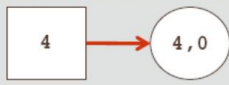

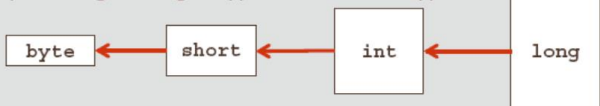

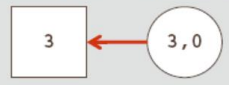

Escape Sequence	Description
\t	Insert a new tab
\b	Insert a backspace
\n	Insert a new line
\r	Insert a carriage return
\f	Insert a formfeed
\'	Insert a single quote character
\"	Insert a double quote character
****	Insert a backslash character

System.out.print**ln**("The cat said \"Meow!\" to me.");
println() vs. print()

System.out.println("1\t2\t3\t\"Hola\" mundo");
1   2   3   "Hola" mundo

System.out.println("Hola\nAdios");
Hola
Adios

```
System.out.println("This is the first line."
            + "This is NOT the second line.");
```
sout tab   "Metodo abreviado"

3.4. Converting Between Data Types

```
double x = 9 / 2; // Should be 4.5
System.out.println(x); // prints 4.0

double y = 4;
System.out.println(y); //prints 4.0
```

```
int    num1 = 7;
double num2 = 2;
double num3;
num3 = num1 / num2; // num3 is 3.5
```

Automatic promotions:
- If you assign a smaller type to a larger type:

byte → short → int → long

- If you assign an integral value to a floating-point type:

4 → 4,0

Examples of automatic promotions:
- `long intToLong = 6;`
- `double intToDouble = 4;`

When to cast:
- If you assign a larger type to a smaller type:

byte ← short ← int ← long

- If you assign a floating point type to an integral type:

3 ← 3,0

Examples of casting:
- `int longToInt = (int)20L;`
- `short doubleToShort = (short)3.0;`

double pi = 3.1416
int entero = (int) pi

127 in binary is 01111111; 128 in binary is 10000000.
Java uses the first bit in a number to indicates sign (+/-)

byte, short, and char values are automatically promoted to int prior to an operation

Solution using larger data type:

```
int num1 = 53;
int num2 = 47;
int num3;          ——— Changed from byte to int
num3 = (num1 + num2);
```

Solution using casting:

```
int num1 = 53;          // 32 bits of memory to hold the value
int num2 = 47;          // 32 bits of memory to hold the value
byte num3;              // 8 bits of memory reserved
num3 = (byte)(num1 + num2); // no data loss
```

Automatic Promotion
- Example of a potential problem:

```
short a, b, c;
a = 1 ;  ⎤
b = 2 ;  ⎦  a and b are automatically promoted to integers
c = a + b ; //compiler error
```

- Example of potential solutions:
  - Declare c as an `int` type in the original declaration:
    - `int c;`
  - Type cast the (a+b) result in the assignment line:
    - `c = (short)(a+b);`

int x = 123_456_789;
int x = 123456789;

intintVar1 = Integer.parseInt("100");
doubledoubleVar2 = Double.parseDouble("2.72");

→

```
    System.out.println("\033[H\033[2J"); // limpiar pantalla

    String input = JOptionPane.showInputDialog(null, "Type a number:");
    int number = Integer.parseInt(input);
    number *= 2;
    JOptionPane.showMessageDialog(null, "El doble es: " + number);
```

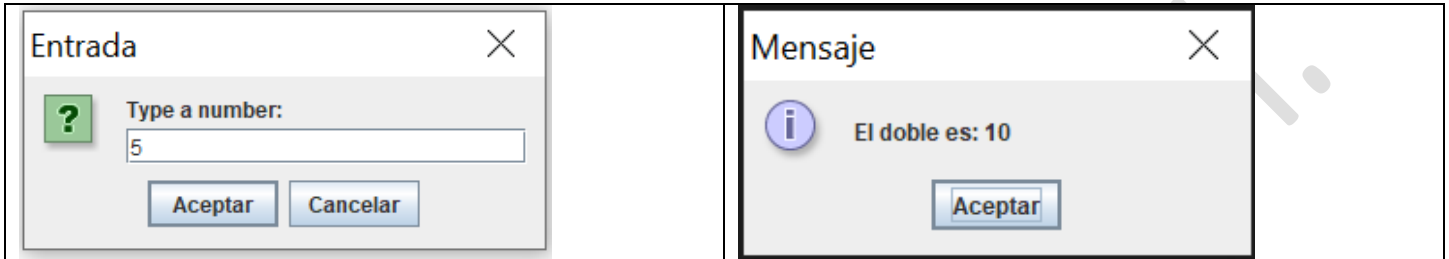

The Scanner searches for tokens

A few useful Scanner methods …
- nextInt() reads the next token as an int
- nextDouble() reads the next token as a double
- next() reads the next token as a String

```
Scanner sc = new Scanner(System.in);
```
The Scanner class considers space as the default delimiter while reading the input

Reading from a File
- nextLine() advances this Scanner past the current line and returns the input that was skipped
- findInLine("StringToFind") Attempts to find the next occurrence of a pattern constructed from the specified String, ignoring delimiters

```
Scanner sc = new Scanner(MyClase.class.getResourceAsStream("texto.txt"));
```

```
        Scanner sc = new Scanner(System.in);
        int  x = sc.nextInt();
        double y = sc.nextDouble();
        String z = sc.next();
        String linea = sc.nextLine();
        int numero = Integer.parseInt(z);
        sc.close();
```

Quiz 1: JFo - Section 3 - L1-L2
Quiz 2: JFo - Section 3 - L3-L5

→

4. Java Methods and Library Classes

4.1. What Is a Method?

Instantiate an object

These classes outline objcts' …
Properties(fields)
Behaviors(methods)

Variables for Objects

```
int        age  = 22;
String     str  = "Happy Birthday!";
Scanner    sc   = new Scanner();
Calculator calc = new Calculator();
```
type   name   value

Method name **Method return type** **Parameters**

```
public double calculate(int x, double y){
    double quotient = x/y;
    return quotient;
}//end method calculate
```
Implementation

```
double tax = 0.05;
double tip = 0.15;

double person1 = 10;
double total1  = person1*(1 +tax +tip);
System.out.println(total1);

double person2 = 12;
double total2  = person2*(1 +tax +tip);
System.out.println(total2);

public void findTotal(double price, String name){
    double total = price * (1 + tax + tip);
    System.out.println(name + ": $ " + total);
} //end method findTotal
```

Method Arguments and Parameters

- An argument is a value that's passed during a method call:

```
Calculator calc = new Calculator();
calc.calculate(3, 2.0);      //should print 1.5
```
Arguments

- A parameter is a variable that's defined in the method declaration:

3   2.0
```
public void calculate(int x, double y){
    System.out.println(x/y);
}//end method calculate
```
Parameters

Method Return Types

- Variables can have values of many different types:

int   double   long   char   float   byte
short   String   boolean   Calculator

- Method calls also return values of many different types:

int   double   long   char   float   byte
short   String   boolean   Calculator

Passing Arguments and Returning Values

1 Value passed from caller method to worker method

Object

Method

2 Value received by worker method

3 Value returned to caller method

ORACLE
```
1  public class Calculator{
2
3
4           Properties
5
6
7
8           Behaviours
9
10
11 }
```

```java
public class Calculator{
    //Fields
    public double tax = 0.05;
    public double tip = 0.15;
    public double originalPrice = 10;

    //Methods
    public void findTotal(){
        //Calculate total after tax and tip
        //Print this value
    }//end method findTotal

} //end class Calculator
```
Calculator calc = **new** Calculator();

4.2. The import Declaration and Packages

java.base (Java SE 17 & JDK 17) https://docs.oracle.com/en/java/javase/17/docs/api/java.base/module-summary.html

Overview (Java SE 15 & JDK 15) https://docs.oracle.com/en/java/javase/15/docs/api/index.html

Package	Purpose
java.lang	Provides classes that are fundamental to the design of the Java language
	By default, the java.lang package is automatically imported into all Java programs
javax.swing	Provides classes to build GUI components
java.net	Provides classes for networking applications
java.time	Providesclasses for dates, times, instants, and durations

import

Import javax.swing.*;   // importar todas las clases

java.util.Scanner keyboard = new java.util.Scanner(System.in);
Scanner sc = new Scanner(System.in);
JOptionPane.showMessageDialog(null, "Hello!");

Quiz 1: JFo - Section 4 - L1-L2
Quiz 2: JFo - Section 4 - L3-L5

→

4.3. The String Class

java.lang.String

In Java, strings are not a primitive data type. Instead, they are objects of the String class.

https://docs.oracle.com/en/java/javase/17/docs/api/java.base/module-summary.html
https://docs.oracle.com/en/java/javase/17/docs/api/java.base/java/lang/String.html
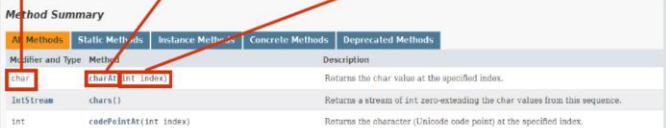

String str = new String("Hello Hi, World");
Not commonly used and not recommended

public int length()	Returns the length of this string Example: LastName.length()
public char charAt(int index)	Returns the char value at the specified index
String **concat**(**String** str)	Concatenates the specified string to the end of this string. String producto = "coca"; producto.concat("cola"); producto= producto.concat("cola"); producto = producto +"cola";
Boolean **contains**(**CharSequence** s)	Returns true if and only if this string contains the specified sequence of char values.
public int indexOf(String str)	Returns the index within this string of the first occurrence of the specified substring
str.indexOf(char c)	Returns the index value of the first occurrence of c in String str
s1.indexOf(char c, int beginIdx)	Returns the index value of the first occurrence of c in String s1,starting from beginIdx to the end of the string
str.substring(int beginIdx)	Returns the substring from beginIdx to the end of the string
str.substring(in tbeginIdx, int endIdx)	Returns the substring from beginIdx up to, but not including, endIdx
String **replace**(char oldChar, char newChar) str.**replace**(**CharSequence** target, **CharSequence** replacement)	This method replaces **all** occurrences of matching characters in a string
replaceFirst(String pattern, String replacement)	replaces only the first occurrence of a matching character pattern in a string
Int **lastIndexOf**(**String** str) Int **lastIndexOf**(**String** str, int fromIndex) **String** trim() **String** **toLowerCase**()	

Strings Are Immutable, its value can't be changed.

String str1 = "Hello"; String str2 = "Hello"; We expect this . . . . but it's wrong 	But this is what happens . . . The Java runtime system knows that the two strings are identical and allocates the same memory location for the two objects.

String s1 ="Susan"; String s2 = "Roberts"; s1 = s1 + s2;		String myString = "Hello"; myString = myString.concat(" World"); myString = myString + "!"	
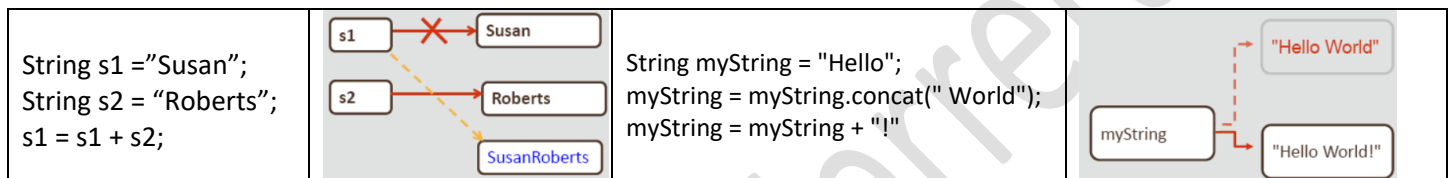

Comparing String

ASCII   '0' = 48   '1' = 49   'A' = 65   'a' = 97

The strings are compared character by character until their order is determined or until they prove to be identical
Syntax: **s1.compareTo(s2)**   Example: int a = "computer".compareTo("comparison");
Returns an integer value that indicates the ordering of the two strings

- Returns == 0   when the two strings are lexicographically equivalent
- Returns < 0   when then the string calling the method is lexicographically first
- Returns > 0   when the parameter passed to the method is lexicographically first

→

4.4. The Random class

import java.util.Random;

- Random rand = new Random();
  - **rand.setSeed(5L);   Colocar una semilla**
- Math.random(); // entre 0 y 1

rand.nextInt(max - min + 1) + min;
(int) (Math.random() * (max - min + 1)) + min;

Method	Produces
boolean nextBoolean();	A true or false value
int nextInt()	An integral value between Integer.MIN_VALUE and Integer.MAX_VALUE
long nextLong()	A long integral value between Long.MIN_VALUE and Long.MAX_VALUE
float nextFloat()	A decimal number between 0.0 (included) and 1.0 (excluded)
double nextDouble()	A decimal number between 0.0 (included) and 1.0 (excluded)

→

4.5. The Math Class

The methods of the Math class are **static methods**

Some of the Methods Available in Math Class

Method Name	Description
abs(value)	absolute value
ceil(value)	rounds up
cos(value)	cosine, in radians
floor(value)	rounds down
log(value)	logarithm base e
log10(value)	logarithm base 10
max(value1, value2)	larger of two values
min(value1, value2)	smaller of two values
pow(base, exponent)	base to the exponent power
random()	random double between 0 and 1
round(value)	nearest whole number
sin(value)	sine, in radians
sqrt(value)	square root

double a = Math.sqrt(121.0);   Math.E   Math.PI

360º = 2π rad   1º = π/180 rad   1 rad = 180/π º

BMI = Peso en libras / Altura en pulgadas^2 * 703   IMC = Peso (kg) ÷ (Altura (m))^2

→

5. Decision Statements

5.1. Boolean Expressions and if/else Constructs

In Java the values for the boolean data type are true and false, instead of yes and no.

boolean bandera = true;
int x = 4;
boolean isFive = x == 5;

Relational Operators

Condition	Operator	Example
Is equal to	==	int i=1; (i == 1)
Is not equal to	!=	int i=2; (i != 1)
Is less than	<	int i=0; (i < 1)
Is less than or equal to	<=	int i=1; (i <= 1)
Is greater than	>	int i=2; (i > 1)
Is greater than or equal to	>=	int i=1; (i >= 1)

Conditional statements in Java are:
if statement
if/else statement
switch statement
== compares the values of primitives
== compares the objects' locations in memory

String x = "Ora";
String y = "cle";
String z = x +y;
boolean test = (z == x + y);
System.out.println(test); //false   Why?
	String x = "Ora";
	String y = "cle";
	String z = x +y;
	boolean test = z.equals(x + y);
	System.out.println(test); //true Why?

Handling Multiple Conditions

```
int grade = 90;                              int grade = 90;
int numberDaysAbsent = 0;                     int numberDaysAbsent = 0;

if (grade >= 88) {                            if ((grade >= 88) && (numberDaysAbsent == 0)) {
    if (numberDaysAbsent == 0) {                  System.out.println("qualify");
        System.out.println("qualify");       } // endif
    } // endif
} // endif
```

Logic Operator	Meaning
&&	AND
||	OR
!	NOT

```
boolean bandera = true;                       boolean bandera = true;
if (bandera) {                                if (!bandera) {
    System.out.println("qualify");                System.out.println("fail");
} else {                                      } else {
    System.out.println("fail");                   System.out.println("qualify");
}                                             }
```

The && and || operators are short-circuit operators

Skipping the Second AND Test   x=0   b = (x != 0) && ((y / x) > 2);

Skipping the Second OR Test   x=0   b = (x <= 10) || (x > 20);

Ternary Conditional Operator

Operation	Operator	Example

If condition is true: assign result = value1 Otherwise: assign result = value2	?:	`result = condition ? value1 : value2`
		Example:
		`int x = 2, y = 5, z = 0;`
		`z = (y < x) ? x : y;`

```
int numberOfGoals = 1;
System.out.println("I scored " + numberOfGoals + " "
        + (numberOfGoals == 1 ? "goal" : "goals"));
```

```java
if (<condition1>){
    //code_block1
} else if (<condition2>){
    // code_block2
} else if (<condition3>){
    // code_block3
} else {
    // default_code
} // endif
```

```java
if (tvType == "color") {
    if (size == 14) {
        discPercent = 8;
    } else {
        discPercent = 10;
    }//endif
}//endif
. . . . . . .
if (tvType == "color") {
    if (size == 14) {
        discPercent = 8;
    } //endif
} else {
    discPercent = 10;
}//endif
```

5.3. switch Statement

```java
switch (<variable or expression>) {
    case <literal value>: //code_block1
                          [break;]
    case <literal value>: // code_block2
                          [break;]
    default: //default_code
}//end switch
```

switch : variable int, short, byte, char, or String

case : valor

break : Salir del switch

default : No encuentra relacion

Solution: if/else Statement

```java
Scanner in = new Scanner(System.in);
System.out.println("Enter your grade");
int grade = in.nextInt();
if (grade == 9){
    System.out.println("You are a freshman");
}
else if (grade == 10) {
    System.out.println("You are a sophomore");
}
else if (grade == 11) {
    System.out.println("You are a junior");
}
else if (grade == 12) {
    System.out.println("You are a senior");
}
else {
    System.out.println("Invalid grade");
}//endif
```

Solution: switch Statement

```java
Scanner in = new Scanner(System.in);
System.out.println("What grade are you in?");
int grade = in.nextInt();
switch (grade) {
    case 9:
        System.out.println("You are a freshman");
        break;
    case 10:
        System.out.println("You are a sophomore");
        break;
    case 11:
        System.out.println("You are a junior");
        break;
    case 12:
        System.out.println("You are a senior");
        break;
    default:
        System.out.println("Invalid grade");
}//end switch
```

What Is switch Fall Through?
- switch fall through is a condition that occurs if there are no break statements at the end of each case statement
- All statements after the matching case label are executed in sequence, regardless of the expression of subsequent case labels, until a break statement is encountered.

```java
int month = 8;
month = in.nextInt();        Only a single value can be tested

switch (month) {
    case 1: case 3: case 5: case 7:      Known values
    case 8: case 10: case 12: System.out.print("31 days");
                              break;
    case 2: if(isLeapYear)){
            ..
```

→

6. Loop Constructs

6.1. for Loops

El numero de ciclos o iteraciones es conocido

La inicialización de la variable solo se ejecuta la primera vez.

La ultima instruccion que se ejecuta **dentro** del ciclo es el incremento o decremento, posteriormente vuelve a iterar **mientras** se cumpla la condición.

```
System.out.println("Countup to Song: ");
for (int i = 1;  i < 9;  i++) {
    System.out.println(i);
    // incremento implicito
} //end for
System.out.println("Mambo!");

System.out.println("Countdown to Launch: ");
int i;   // Scope
for (i = 10;  i >= 0;  i--) {
    System.out.println(i);
} //end for
System.out.println("Despegamos!: " + i );
```

Variable Scope
Variables cannot exist before or outside their block of code.

```java
import java.util.Scanner;
public class PracticeCode {
public static void main(String[] args){
        Scanner in = new Scanner(System.in);
        int N = 100;
        int total = 0;
        System.out.println("This program adds " + N + " numbers.");
        for(int i = 0; i < N; i++){
        System.out.println(("Enter your next number:");
                int value = in.nextInt();
                total += value;
        }//end for
        System.out.println("The total is " + total + ".");
    }//end method main
```

N
total
i
value

Variable Already Defined	Out of Scope

```java
public static void main(String[] args) {

    int i = 0;

    for(int i = 64; i >0; i=i/2 ){
        System.out.print(i +" ");
    }

}
```
i

```java
public static void main(String[] args) {
    for(int j = 0; j<=5; j++){
        System.out.print(j +" ");
    }
j

    for(int j = 5; j>=0; j--){
        System.out.print(j +" ");
    }
j

    for(int k = 2; k<=64; k=k*2){
        System.out.print(j +" ");
    }
k

}
```

6.2. while and do-while loops

How Many Times to Repeat?

- In some situations, you don't know how many times to repeat something
- That is, you may need to repeat some code until a particular condition occurs

<table>
<tr><td>

Pre-test

```java
while (<boolean expression>) {
    <statement(s)> ;
}//end while
```

Post-test (mínimo una vez)

```java
do{
 <statement(s)>
}while(<condition>);
```

The do-while loop requires a **semicolon** after the condition at the end of the loop

</td><td>

```java
int i = 10;
System.out.println("Countdown to Launch!");
while (i >= 0) {
    System.out.println(i);
    i--; // i++;
} //end while
System.out.println("Blast Off!");
. . . . . . . . . . . . . . . . . . . .
int i = 10;
System.out.println("Countdown to Launch!");
do {
    System.out.println(i);
    i--;
} while (i >= 0);
System.out.println("Blast Off!");
```

</td></tr>
</table>

```for (int i = 10; i >= 0; i--) { System.out.println(i); } System.out.println("Blast Off!");```	```int i = 10; while (i >= 0) { System.out.println(i); i--; } System.out.println("Blast Off!");```

```
Scanner console = new Scanner(System.in);
int sum = 0;

System.out.println("Enter a number (-1 to quit): ");
int num = console.nextInt();
while (num != -1) {
    sum = sum + num;
    System.out.println("Enter a number (-1 to quit): ");
    num = console.nextInt();
} // end while
System.out.println("The sum is " + sum);
```

6.3. Using break and continue Statements

Use a **continue** statement to skip part of a loop   up
Use a **break** statement to exit a loop   down
Se pueden usar en cualquier ciclo: for, while, do while

```while(condition){ statement1; Control passes to the loop condition statement2; continue; statement3; ┐ statement4; ┘ These statements are skipped in the current iteration } statement; [statement outside the while loop]```	```while(condition){ statement1; statement2; break; statement3; Control passes to the statement4 statement outside the loop } statement; [statement outside the while loop]```

```
int i = 0;
while (i < 10) {
    if (i == 4) {
        break;
    }
    System.out.println(i+ "\t");
    i++;
}
System.out.println("\n. . .Fin");
```

→

7. Creating Classes

7.1. Creating a Class

https://objectstorage.uk-london-1.oraclecloud.com/n/lrvrlgaqj8dd/b/Games/o/JavaPuzzleBall/index.html

```
1 public class SavingsAccount {
2
3                 Properties
4
5
6                 Behaviors
7
8
9 }
```

```
1 public class SavingsAccount {
2     public double balance;
3     public double interestRate = 0.01;
4     public String name;
5
6     public void displayCustomer(){
7       System.out.println("Customer: "+ name);
8     }//end method displayCustomer
9 }//end class SavingsAccount
```

Method return type **Method name** **Parameters**

```
public double calculate(int x, double y){
    double quotient = x/y;
    return quotient;                      Implementation
}//end method calculate
```

```
0–11 months : 0,5%
12–23 months : 1,0%
24–35 months : 1,5%
36–47 months : 2,0%
48–60 months : 2,5%
```

En base a t(tiempo) obtener el rate(porcentaje)

```java
Public void setTermAndRate(int t){
    if(t>=0 && t<12)
        rate= 0.005;
    else if(t>=12 && t<24)
        rate= 0.010;
    else if(t>=24 && t<36)
        rate= 0.015;
    else if(t>=36 && t<48)
        rate= 0.020;
    else if(t>=48 && t<=60)
        rate= 0.025;
    else {
        System.out.println("Invalid Term");
        t = 0;
    }
    term= t;
}
```

→

```java
public class Cuenta {
    int numeroID;  // Numero de Tarjeta
    String titular;
    double saldo;

    public double getSaldo() {
        return saldo;
    }

    public void depositar(double monto) {
        saldo += monto;
    }

    public void retirar(double monto) {
        if (monto <= saldo) {
            saldo = saldo - monto;
        } else {
            System.out.println(
                "Sin suficiente saldo");
        }
    }
}
```

```java
public static void main(String[] args) {
    Cuenta cuenta1 = new Cuenta();
    cuenta1.numeroID = 1;
    cuenta1.titular = "Jesus";
    cuenta1.saldo = 1000;  // warning
    cuenta1.depositar(500);

    //Cuenta cuenta2 = new Cuenta(2, "Maria", 2000);
    //Cuenta cuenta3 = new Cuenta(3, "Jose",  3000);

    System.out.println(cuenta1.getSaldo());

    Cuenta[] cuentas = new Cuenta[3];
    cuentas[0] = cuenta1;
```

7.2. Instantiating Objects

Understand object references.
Understand the difference between stack and heap memory
Understand how Strings are special objects

```java
int x;
int y;

x = y;

x = 1;
y = 2;

System.out.println(x);
System.out.println(x == y);
```
¿Que imprime?

Strings Are Special Objects.

Strings should be instantiated without new
This is more memory-efficient

String s1 = "Test";

But you shouldn't do this
String s2 = new String("Test");

String s3 = "Test";

System.out.println(s1 == s2); ??
System.out.println(s1 == s3); ??

```java
public class Prisoner {
    public String name;
    public double height;
    public int sentence;
}
```

```java
public static void main(String[] args){
    Prisoner bubba  = new Prisoner();
    Prisoner twitch = new Prisoner();
    System.out.println(bubba); // Prisoner@15db9742
    System.out.println(twitch);// Prisoner@6d06d69c
                        // Memory addresses
}
```

Variable: **bubba**	Variable: **twitch**
Name: Bubba	Name: Bubba
Height: 6'10" (2.08m)	Height: 6'10" (2.08m)
Sentence: 4 years	Sentence: 4 years
Memory Address :@15db9742	Memory Address :@6d06d69c

Each object will have a different location in memory

bubba ⟶ Cell A1

A1	B1	C1	D1	E1	F1
A2	B2	C2	D2	E2	F2

twitch ⟶ Cell F2

Working with Object References: Example 1

remote1

remote2

```
Camera remote1 = new Camera();
Camera remote2 = new Camera();

remote1.play();
remote2.play();
```

There are two Camera objects

Working with Object References: Example 2

remote1   remote2

There's only one Camera object

```
Camera remote1 = new Camera();

Camera remote2 = remote1;

remote1.play();
remote2.stop();
```

References to Different Objects: Example

Reference type   Reference variable   Object type

```
Camera remote1 = new Camera();
remote1.menu();

TV remote2 = new TV();
remote2.menu();

Prisoner bubba = new Prisoner();
bubba.think();
```

References to Different Objects: Example

🚫 `Prisoner twitch = new TV();`

Caballo extends Animal { … }   // El caballo **ES UN** Animal
Animal potro = new Caballo();

Stack memory is used to store …
- Local variables
- Primitives
- References to locations in the heap memory
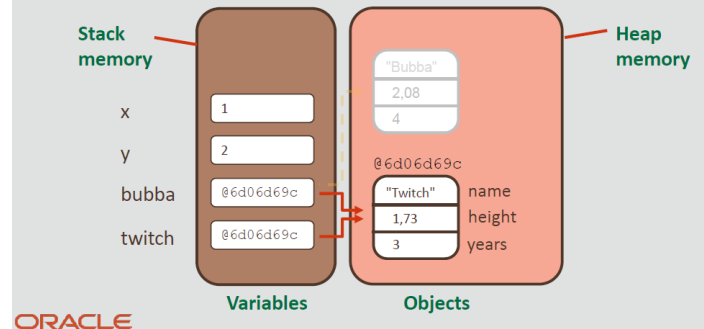

Heap memory is used to store …
- Objects

References and Objects in Memory

```java
int x = 1;
int y = 2;
Prisoner bubba = new Prisoner();
Prisoner twitch = new Prisoner();
…
```

Stack memory — **Heap memory**

		@15db9742
x	1	"Bubba" name
y	2	2,08 height
bubba	@15db9742	4 years
twitch	@6d06d69c	@6d06d69c
		"Twitch" name
		1,73 height
		3 years

Variables   **Objects**

ORACLE
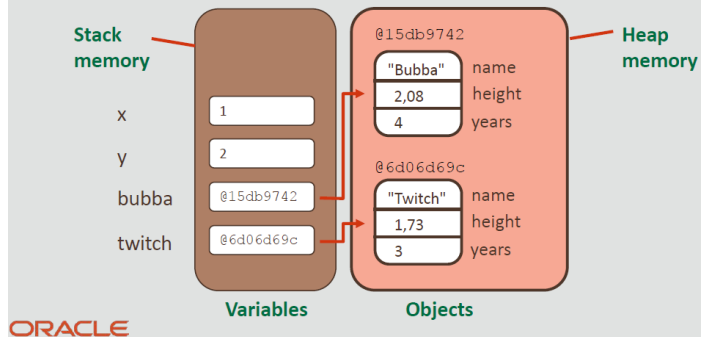

Assigning a Reference to Another Reference

```java
bubba = twitch;
```

Stack memory — **Heap memory**

		"Bubba"
x	1	2,08
y	2	4
bubba	@6d06d69c	@6d06d69c
twitch	@6d06d69c	"Twitch" name
		1,73 height
		3 years

Variables   **Objects**

ORACLE

```java
bubba.name= "Bubba";
twitch.name= "Twitch";
System.out.println(bubba.name);        ??
System.out.println(twich.name);        ??
System.out.println(bubba == twitch);   ??
```

Si ninguna variable de referencia apunta a un objeto... Java borra automáticamente la memoria que ocupaba ese objeto. Esto se denomina recolección de basura (**Garbage Collection**). Los datos asociados a este objeto se pierden para siempre.
